# Living Profiles of Older Persons and Social Policies on Ageing in Korea 

Korea Institute for Health and Social Affairs

## Foreword

The last several decades have witnessed rapid demographic change in Korea. Declining fertility has had a major impact on the structural aging of populations and has also reduced mortality rates, which were formerly higher for children and middle-aged persons and are now higher for older persons.

As a result, the proportion of the population under 14 years of age is decreasing, while that of the population 65 years of age and over is increasing. The proportion of the total population aged 65 and over was 3.1 in 1970, compared with 6.8 in 1999. Moreover, that proportion is expected to be 7.1 in 2000 and 14.3 in 2022.

Korea is now on the verge of becoming an aging society and the speed of the aging rate is unprecedentedly fast. It is expected that it will only take 22 years for Korea to move from being an aging society to an aged society. The speed of aging in Korea is much faster than when compared to other countries.

More significantly, the trend in family dynamics is leaning toward more nuclearization. Along with rapid population aging, the fact that a significant and increasing proportion of the Korean elderly are living apart from their children indicates the increasing social need to care for the elderly. The increasing interest in social policy concerning aging is not only a result of population aging but also of the weakening of the care-giving role of the family.

There is an urgent need to establish a social infrastructure that can adequately respond to population aging. The Korean government is subsequently becoming increasingly involved in welfare programmes for older persons. The government is
focusing on the increasing dependency needs of older persons and on the preparation of appropriate countermeasures. It is therefore necessary to identify the needs of older persons and welfare services required that they require.

This study focuses on living profiles, welfare policies, and programmes for older persons and the evaluation of policy directions. I sincerely hope that this publication will be helpful to those who are interested in the lives of older persons and the current welfare policies for them in Korea. This report may also prove to be valuable to policy planners in other countries who are likewise trying to develop new welfare policies and programmes for older persons.

This publication has been prepared by Dr. Kyunghee Chung at the Korea Institute for Health and Social Affairs. I would like to thank Dr. Kyunghee Chung, Ms. Aejeo Cho, Ms. Younghee Oh, Dr. Jaekwan Byun, Dr. Youngchan Byun, and Mr. Hyunsang Moon, who were all involved in the 'Living Profile and Welfare Service Needs of Older Persons in Korea' survey conducted by KIHASA and are co-authors of the Korean version of the survey report. I would also grateful to Dr. Jaekwan Byun, Dr. Kyunghee Chung, Dr. Meekyung Suh, Ms. Jaeeun Seok at KIHASA and staff at the Elderly Welfare Division of the Ministry of Health and Welfare, who have all helped to develop the plan ${ }^{『}$ Mid- to Long-Term Development Directions for Elderly Health and Welfare in Preparation of an Aging Society in the 21st Centur $\mathrm{y}_{』}$. Finally, many thanks are extended to Ms. Julie Oh for her valued advice in preparing the English version of this paper.

## Chapter 1. Introduction

As a result of the rapid decrease in fertility and the substantial increase in life expectancy, the percentage of population under the age of 14 is decreasing, while the percentage of the population 65 years of age and over is increasing. Korea is now on the verge of becoming an aging society and the speed of the aging rate is unprecedentedly fast. It is expected that it will only take 22 years for Korea to move from being an aging society to an aged society. Therefore, Korean society will soon be faced with population aging despite the fact that they still lack the necessary preparation.

Care for the elderly has become a central social issue with the increase in percentage of older persons. The increasing interest in social policy concerning the aging problem is not only a result of population aging but also the weakening of the care-giving role of the family. Along with rapid population aging, the fact that a significant and increasing proportion of the Korean elderly are living apart from their children indicates the increasing social need to care for the elderly.

The objective of this study is to collect and analyze existing statistics and studies on aging and to examine current social welfare policies and programmes for older persons. This study is composed of four parts. First, demographic changes and changes in the family will be reviewed as background to understanding older persons lives. Second, living profiles and welfare service needs of older persons will be presented based on survey data. Third, policies and programmes pertaining to older persons will be introduced. Finally, the current situation and future plans of the Korean government will be summarized.

# Chapter 2. Changes in Population and the Family 

## A. Demographic Changes

## 1) Age Composition of the Population

Due to the rapid decrease in the fertility rate and the sustained increase in life expectancy, the number and proportion of the youth population has decreased while at the same time, the number and proportion of the aged population has substantially increased.

The proportion of the total population aged 65 and over was 3.1 percent in 1970, compared to 5.7 in 1995. Moreover, the corresponding proportion is expected to be 7.1 in 2000 and 14.3 in 2022. Similar trends have been observed and are expected to continue in the old age dependency ratio and index of aging(see Table 2-1).

According to a recent census, the total number of persons 65 years old and over was 2,657,000 in 1995. This is 2.7 times larger than in 1970, when there were 991,000 persons. It is estimated that there will be $6,899,000$ older persons in 2020 , which is 2.6 times more than in 1995. The growth rate is even greater among persons 80 years old and over; in 2020 the number of persons 80 year old and over will be 3.5 times more than in 1995(see Table 2-2).

The increase in the proportion of older persons is largely due to the decrease in birth rate and sustained increase in life expectancy following socio-economic development and improvement in public health and medical technology in Korea.

The crude birth rate was 29.5 per 1,000 persons in 1970 but decreased to 14.6 per 1,000 persons in 1997(see Table 2-3).

As a result of the above factors, the life expectancy at birth for females increased from 66.7 in 1970 to 77.4 years in 1995, in other words a 10.7 year extension of life in 25 years. The life expectancy of Korean women has now reached the level of life expectancy in advanced countries. In contrast, the increase in male life expectancy at birth has been far less than that of females for the same period. Life expectancy for males at birth increased 9.7 years, from 59.8 to 69.5 . Life expectancy in 2020 is expected to be 81.7 years for females and 74.5 for males(see Table 2-4).

Considering that women's life expectancy is generally longer than men's, the difference of 7.9 years between males and females is quite large compared to the usual gender differences noted in advanced countries ${ }^{1}$ ).

## 2) Sex Ratio and Mantal Status

By virtue of gender differences in life expectancy and age-differences in couples, the sex ratio of older persons is much lower compared to that of the total population. The sex ratio of the total population was 100.8 in 1995. On the other hand, the sex ratio of persons 65 years old and over was 58.5 . The sex ratios for age groups 65 to 69,70 to $74,75 \sim 79,80 \sim 84$, and 85 and over were $40.6,26.2,15.9,8.5$, and 3.3 respectively in 1995, showing a remarkably higher rate of female population at older ages.

Regarding the marital status of older persons, the proportion of married persons is higher among the male elderly and lower age groups. The majority of elderly males aged 65~69(90.1 percent) are married. In contrast, only 3.3 percent of elderly males aged 85 are married.

As a result of the higher rate of widows and lower rate of re-marriage among female elderly, 39.4 percent of elderly males
lived with their wives, while only 12.9 percent of elderly females lived with their husbands in 1995(see Table 2-5).

Table 2-5. Demographic and Household Composition of Older Persons, 1995

| Age | Sex <br> Ratio | \% of <br> Currently <br> Married |  | Household Composition |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Male | Female | Male |  | Female |  |

Source: National Statistical Office, Population and Housing Census Report, 1995.

## 3) Area Differences

The proportion of older persons, compared to the total population, in rural areas is significantly higher than in urban areas. In 1995, 4.3 percent of elderly persons 65 years old and over lived in urban areas, but 11.8 percent lived in rural areas. This trend results from the rapid emigration of younger generations from rural to urban areas(see Table 2-6).

National Statistical Office, Population and Housing Census Report, 1990, 1995.

## B. Changes in the Family

## 1) Household and Family Types

The total number of households in Korea has doubled since 1970. In 1995, the number of households reached $12,958,000$ which is an increase of $5,779,000$ households from 1970 (see Table 2-7). Meanwhile, the average number of household members recorded a decline from 5.2 persons in 1970, to 4.6 in 1980, and to 3.3 in 1995. This trend is mainly the result of the decline in average number of births per woman.

In terms of household type, one person households increased from 4.2 percent of total households in 1975 to 12.7 percent in 1990. This reflects an increase in the number of one-person households among elderly in rural areas and an increase in the number of young people who live alone in urban areas.

In regards to the number of generations represented in one family, two generation families accounted for 73.7 percent of all families. One generation families accounted for 12.7 percent, up from 6.8 percent in 1970, while three generation families decreased from 23.2 percent in 1970 to 11.6 percent in 1995. Furthermore, nuclear families are the most common family type in Korea, accounting for 79.8 percent of all families in 1995. The decline in the size of families can be traced to the decline of
fertility in Korea. Total fertility rates decreased from 2.7 in 1980 to 1.6 in 1990(see Table 2-7).

Table 2-7. Changes in the Family Structure in Korea, 1970~1975

## 2) The Fonmation of Families

According to the 1995 Population and Housing Census Report, the number of people who have never been married accounted for 30.8 percent of the population 15 years of age and over, while married people represented 60.7 percent, widowed people 7.4 percent and divorced people 1.1 percent. The average age at first marriage has increased for women from an average of 23.3 in 1970 to 25.9 in 1997. Similarly, men's average age at marriage increased from 27.1 in 1970 to 28.7 in 1997(see Table 2-8).

The crude divorce rate increased from 0.4 in 1970 to 2.0 in 1997. Furthermore, according to vital registration statistics, divorce
due to troubles with one's spouse increased from 65 percent of all divorces in 1970 to 81 percent in 1997. Other types of reasons for divorce are troubles with family members, ill health, and economic problems. Therefore, the need for programs designed to help prevent divorce and to support members of dissoluted families is increasing.

Table 2-8. Formation and Dissolution of Families, 1970~1997

## 3) Changes in the Fanily Life Cycle

A decline in fertility, marriage at a later age, and a longer life expectancy have brought about changes in the life cycle of women. Although the total duration of the family life cycle has extended, the family extension stage has shortened. The duration from the birth of the first child to the birth of the last has decreased from 16 years (currently 70 years of age), to 9 years
( 55 years of age) to 2 years ( 37 years of age). Although the total number of years of childbearing and rearing has decreased, the years devoted to rearing one child has increased. The burden of child rearing has therefore, not been notably alleviated despite the decline in fertility(see Table 2-9).

The shortened family extension stage allows for more active labor force participation by women. Moreover, the centrality of child rearing has decreased, and the quality of the conjugal relationship has become more important.

The duration of the empty-nest period has also increased. Therefore, the economic, psychological, and emotional issues of middle-aged or elderly couples have recently gained more importance.

Table 2-9. Changes in the Family Life Cycle in Korea
(Unit: years)

| Phases of Family Life Cycle | Marriage Cohort of Women |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

Source: Kong et al., Changes in Family Structure, 1987.

## 4) Labor Force Participation of Women

Korean women have become more involved in economic activities. The labor force participation rate among women showed an increase from 42.8 percent in 1980 to 49.5 percent in 1997. The labor force participation rate increase is greater among married women than unmarried women. The labor force participation rate among married women showed an increase from 40.5 percent in 1981 to 51.7 percent in 1997(see Table 2-10).

The age pattern regarding the percent of women in the labor force shows a bimodal distribution similar to the pattern in industrialized countries in the 1960s and 1970s(see Table 2-11). This pattern reflects the fact that women actively hold jobs before marriage(20-24 years old), then leave the labor market to give birth and raise their children( $25 \sim 34$ years old), and later reenter the labor market( 35 years old and over). In particular, the labor force participation rate of females $40 \sim 59$ years old and over, who are usually care-givers for older persons, is relatively high ( $50 \sim 60$ percent).

Table 2-10. Labor Force Participation Rate by Marital Status

| Participation Rate | 1980 | 1985 | 1990 | 1995 | 1997 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Total | 40.0 | 41.9 | 47.0 | 48.3 | 49.5 |
| Married | 50.8 | 41.0 | 46.8 | 47.6 | 51.7 |
| Unmarried | 42.8 | 44.7 | 45.6 | 50.4 | 46.2 |

Source: National Statistical Office, Annual Report on the Economically Active Population Survey, Various Years.

A number of factors are believed to be responsible for this increase among married women. First, increased living standards and larger educational expenses for children have prompted housewives to earn money to supplement their husbands' incomes. According to the Social Statistics Survey conducted by the National Statistical Office in 1995, the most common reason women gave for working was "to help with family finances." Second, women have a stronger desire to take part in economic activities and are able to adapt themselves to careers more readily than their predecessors. According to the same survey, the proportion of women who classify their role as full-time homemaker or who were employed before marriage is less than one-fourth. The younger the respondents, the higher the proportion of women with favourable attitudes toward female employment.

# Chapter 3. Living Profile and Welfare Service Needs of Older Persons 

This chapter will overview the living conditions and welfare service needs of older persons based on the 'Living Profile and Welfare Service Needs of Older Persons in Korea' survey conducted by KIHASA from April $13 \sim$ May 31, 1998. The survey was based on 9,355 households and 2,535(2,372 after weighted calculation) older persons 65 years of age or over were interviewed.

Of the respondents, 63.0 percent lived in urban areas and 37.0 percent in rural areas. 36.9 percent were male and 63.1 percent were female. In terms of age, 38.1 percent were ages 65 $\sim 69$, 29.2 percent were ages $70 \sim 74$, and 32.7 percent were ages 75 and over. The educational attainment of older persons was very low; 29.2 percent were illiterate, 23.7 percent could read but had not received formal education, and 29.6 percent were primary school graduates. Only 13.4 percent were middle school graduates and 4.1 percent were college school graduates and over.
49.2 percent of the respondents were married, 50.8 percent were unmarried and the average number of living children was 4.6. Almost half of the respondents( 36.0 percent) did not have any religious affiliation, 33.5 percent were Buddhists, 20.5 percent were Protestants, and 7.4 percent were Catholics(see Table 3-1).

## A. Living Arrangements

Out of the 9,355 households interviewed, 20.9 percent were households with older persons and 79.1 percent were households without(see Table 3-2). When comparing the distribution of
households with older persons, we find that the rate in rural areas( 35.3 percent) is higher than in urban areas( 18.3 percent).

Table 3-1. Characteristics of Older Persons by Area

| Characteristics |  |  | (Unit: \%) |
| :--- | ---: | :---: | :---: |
| Gender | Urban | Rural |  |
| $\quad$ Male |  |  |  |
| Female | 36.9 | 35.5 | 39.1 |
| Age | 63.1 | 64.5 | 60.9 |
| 65~69 |  |  |  |
| $70 \sim 74$ | 38.1 | 39.5 | 35.5 |
| $75+$ | 29.2 | 29.4 | 29.0 |
| Mean(Year) | 32.7 | 31.1 | 35.5 |
| Educational Attainment | 72.6 | 72.4 | 72.9 |
| $\quad$ Illiterate |  |  |  |
| No Formal Education but Literate | 29.2 | 25.2 | 36.1 |
| Primary School Graduate | 23.7 | 19.9 | 30.2 |
| Middle School Graduate | 29.6 | 31.7 | 25.9 |
| High School Graduate | 7.3 | 9.2 | 4.1 |
| College Graduate and Over | 6.1 | 8.2 | 2.5 |
| Marital Status | 4.1 | 5.8 | 1.2 |
| Married |  |  |  |
| Unmarried | 49.2 | 46.9 | 53.1 |
| Religion | 50.8 | 53.1 | 46.9 |
| $\quad$ None |  |  |  |
| Buddhism | 36.0 | 31.5 | 43.7 |
| Protestantism | 33.5 | 33.7 | 33.2 |
| Catholicism | 20.5 | 23.2 | 15.9 |
| Others | 7.4 | 9.5 | 3.8 |
| Total | 2.6 | 2.1 | 3.4 |
| (Persons) | 100.0 | 100.0 | 100.0 |

Table 3-2. Proportion of Households with Older Persons

|  | (Unit: \%, Households) |  |  |
| :--- | :---: | ---: | ---: |
| Households with Older Persons | Whole | Urban | Rural |
| Households without Older Persons | $7,958(20.9)$ | $1,253(17.0)$ | $705(735.3)$ |
| Total | $9,355(100.0)$ | $7,356(100.0)$ | $1,999(100.0)$ |

Among households with older persons, 20.1 percent lived alone, 21.6 percent lived only with their spouses, and 5.1 percent lived with others. 53.2 percent of households with older persons lived with their children. We can also observe from Table 3-3 that there is a big difference between rural and urban areas. In rural areas, the rates of older person only households and older person households only with a couple were 23.6 percent and 27.5 percent respectively, while the rates in urban areas were 18.1 percent and 18.3 percent, respectively.

Table 3-3. Living Arrangement of Older Persons
(Unit: \%)

|  | Household with Older Persons |  |  | Total <br> Area | Older <br> Persons <br> Living Alone |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Elderly Living <br> with Spouses <br> Only | Elderly Living <br> with Children | Others | (Households) |  |  |

Note: 1) Includes households where both the husband and wife or where just one person in the couple is 65 years old or over.

## B. Inter-generational and Social Relationships

## 1) Size of Social Resources

On average, older persons have 4.6 children, 2 siblings, and 2.3 close friends or neighbors as social resources. Male elderly have more children and friends or neighbors than female elderly. According to Table 3-4, male elderly have 4.7 children and 2.8 close friends and/or neighbors, which is higher than the 4.5 and 2.0 for female elderly.

Table 3-4. Number of Children, Siblings, Friends and/or Neighbors by Area, Gender, and Age

|  | Children | Co-resident Children | Siblings | Friends and/or Neighbors ${ }^{1)}$ |
| :---: | :---: | :---: | :---: | :---: |
| Total | 4.6 | (0.5) | 2.0 | 2.3 |
| Area |  |  |  |  |
| Urban | 4.2 | (0.6) | 2.0 | 2.3 |
| Rural | 5.1 | (0.4) | 1.9 | 2.3 |
| Gender |  |  |  |  |
| Male | 4.7 | (0.5) | 1.9 | 2.8 |
| Female | 4.5 | (0.6) | 2.0 | 2.0 |
| Age |  |  |  |  |
| 65~69 | 4.4 | (0.5) | 2.5 | 2.7 |
| $70 \sim 74$ | 4.7 | (0.5) | 2.0 | 2.1 |
| 75+ | 4.6 | (0.6) | 1.4 | 1.9 |
| Note: 1) Friends and/or neighbors whom older persons can rely on for assistance. |  |  |  |  |

2) Frequency of Visits and Calls or Letters with Non-coresident Children, Siblings, Relatives, and Friends and/or Neighbors

As shown in Table 3-5, 77.3 percent of older persons see their children at least once a month and only 1.2 percent do not have any regular contact with their non-coresident children. 74.5
percent of older persons have contact with their non-coresident children by phone or letter at least once a week and only 1.8 percent have contact less than once a year. Older persons get in touch with their children very often despite the fact that they have few opportunities to meet their children because of difficulties such as long distances or lack of time.

On average, older persons see their non-coresident children at least once a month and have contact at least once a week. On the other hand, only less than 2 percent of older persons do not have a continuing relationship with their children. We can observe that the majority of Korean elderly have regular contact with their non-coresident children.

The largest proportion of older persons(27.8 percent) answered that they see their siblings only on special days. Only 20.6 percent meet their siblings at least once a month. This rate is much lower than the corresponding rate( 77.3 percent) for children living separately. 45.1 percent have contact once or more a month.

Almost half of older persons meet their relatives on special days only(43.3 percent) and 12.4 percent do not meet their kin at all. We can see the same trend in number of contacts. 30.2 percent, the highest rate, contact their relatives only on special days. The next group never(13.5 percent) has contact. Only 26.5 percent have contact with their relatives once or more a month. This rate is much lower than the corresponding rate(45.1 percent) for siblings.

As shown in Table 3-5, 55.8 percent meet their friends and/or neighbors almost everyday. The next group meets twice or three times a week(11.2 percent), followed by once a week(9.9 percent), once every two weeks( 2.8 percent), and once a month(5.5 percent). 85.2 percent of older persons meet their friends and/or neighbors at least once a month. On the other hand, 10.8 percent do not meet their friends and/or neighbors at all. This is similar to frequency of visits, where almost half of the respondents(44.0 percent) answered that they do not need to
contact them because they meet them everyday. 16.5 percent of the respondents do not have any contact with relatives.

Table 3-5. Frequency of Visits and Calls or Letters with Non-coresident Children, Siblings, Relatives, and Friends-Neighbors

| Frequency |  |  |  | (Unit: \%) |
| :--- | ---: | ---: | ---: | ---: |

## C. Economic Security

## 1) Employment

The labor force participation rate of older persons is 29.0 percent. The labor force participation rate of male elderly( 39.8 percent) is much higher than that of female elderly(22.6 percent). We can also find from Table 2-6 that there is a big difference between rural and urban areas. In urban areas, the rate is 49.1 percent, while the rate in rural areas is 17.1 percent. Also, the rate decreases as age increases( $65 \sim 69$ years of age: 40.2 percent, $70 \sim 74$ years of age: 28.5 percent, 75 years of age and over: 16.3 percent).

The kinds of jobs in which older persons work are shown in Table 3-6. Of older persons who work, 60.4 percent work in agriculture, forestry, and fishing. The next group is elementary occupations(21.5 percent), then white collar occupations including legislators, senior officials \& managers(2.0 percent), professionals(1.9 percent), technicians \& associate professionals(1.1 percent), and clerks( 1.2 percent). This indicates that the elderly who do work are engaged in non-salary receiving jobs including self-employment or family businesses. The rate of older persons working in agriculture, forestry, and fishing is higher in rural areas(83.4 percent) than in urban areas(21.6 percent). In addition, as the age of the person increases so does the rate of older persons working in agriculture, forestry, and fishing.

Among the reasons for working, the most highly ranked one is 'to earn money'(66.1 percent). The next most frequent answers are they 'enjoy working'(8.2 percent), 'to keep healthy'(7.2 percent), 'due to the lack of labor force(6.9 percent)'.

Table 3-6. Labor Force Participation Rates and Occupations by Area, Gender, and Age

Among older persons who are currently not working, 44.9 percent answered that they do not work because of their health. The next groups are 'no desire to work'(20.2 percent), 'no jobs available'(14.0 percent), and 'too old to work'(9.5 percent). We have to pay attention to the fact that in urban areas 16.8 percent of older persons who are not working currently do not work because there are no jobs available(see Table 3-8).

Table 3-7. Reasons for Working
(Unit: \%)

| Reasons | Total | Area |  | Gender |  | Age |  |  |

| (Person) | $(1,541)$ | $(1,149)$ | (392) | (481) | $(1,060)$ | (522) | (473) | (546) |

## 2) Sources of Income

66.3 percent of older persons receive financial support from children and/or spouses of children that are non-coresident.

Considering the fact that 23.3 percent of older persons receive financial support from their coresident children, we can see that the most important sources of income are their children(see Table 3-9).
33.7 percent of older persons have income from their own and/or their spouses' employment. Other groups receive income from real estate or renting(12.0 percent), and public assistance(8.5 percent). Only a small portion of older persons have income from a pension, retirement annuity, and private pension; 2.8 percent, 0.9 percent, and 0.2 percent, respectively.

Table 3-9. Sources of Income by Area, Gender, and Age
(Unit: \%)

| Sources of Income | Total | Area |  | Gender |  | Age |  |  |

Footnote: 1) Multiple choices

## 3) Spending

Living expenses for oneself or spouse is listed as the most economically burdensome item of older persons(see Table 3-10). The next groups are medication \& medical expenses(24.8
percent), living expenses for the whole family(13.6 percent), and allowance for oneself or spouses(12.3 percent).

Table 3-10. Economically Burdensome Items

| (Unit: \%) |  |  |  |

| (Person) | $(2,221)$ | $(2,221)$ | $(2,221)$ |

On average, older persons spend 79 thousand Won a month on allowance. The amount of allowance increases the younger or the more highly educated the older person is. In terms of gender, male elderly spend more on allowance(119 thousand Won per month)than female elderly(55 thousand Won per month). We can also observe that the amount for married elderly(98 thousands Won per month) is larger than that of the unmarried elderly(60 thousand Won per month). The average amount of monthly allowance is much lower(68 thousand Won per month) for older persons living alone(see Table 3-11).

| College School Graduates and over | 3.4 | 17.8 | 24.4 | 54.5 | 100.0 | ( 95) | 234 |

This part is concerned with housing, food, clothing, medication and health maintenance, allowance, and leisure costs(see Table 3-12). Among the six items, housing(61.0 percent) is the highest item for which older persons are completely independent on other persons. The next groups are food(58.9 percent), money given for condolences, congratulations, or social gatherings(57.2 percent), leisure activities(55.8 percent), clothes and living expenses(44.3 percent), and medication and health maintenance(43.5 percent).

## 4) Self-perception of Economic Status

Table 3-13 shows that almost half of older persons percept their economic situation to be lower than that of their peer group, and that only 11.2 percent of older persons percept their status to be higher or somewhat higher than their peer groups. 28.4 and 21.5 percent feel that their economic status is somewhat lower and very lower, respectively. Compared to male elderly(15.5 percent), more female elderly(25.0 percent) feel their economic status to be lower than peer elderly. We can also observe that self-perception of economic status becomes more positive with higher educational attainment.

## D. Health Status

## 1) Chronic Diseases

The proportion of older persons with at least one chronic disease was 86.7 percent. Female elderly have a rate of 92.2 percent, showing that only a small portion of female elderly do
not have a chronic disease. As the age of the respondents increases, so does the prevalence rate of chronic diseases( $65 \sim 69$ years of age, 85.2 percent; 70~74 years of age, 87.6 percent; 75 years of age and over, 87.8 percent). Overall, the prevalence of chronic diseases in rural areas is higher than in urban areas.

Among various chronic diseases, arthritis is the most prevalent(43.4 percent). 2 out of 5 older persons suffer from arthritis. 84.4 percent of older persons with arthritis have difficulties in their daily living.

Table 3-14. Prevalence Rate of Chronic Diseases by Age and Gender

|  |  |  |  | (Unit: \%) |
| :---: | :---: | :---: | :---: | :---: |
|  | Total | 65~69 | 70~74 | 75+ |
| Total | 86.7 | 85.2 | 87.6 | 87.8 |
| Area |  |  |  |  |
| Urban | 85.3 | 82.9 | 88.1 | 85.8 |
| Rural | 89.1 | 89.6 | 86.8 | 90.7 |
| Gender |  |  |  |  |
| Male | 77.4 | 75.8 | 79.4 | 78.0 |
| Female | 92.2 | 92.0 | 92.0 | 92.5 |

## 2) Dementia

The prevalence rate for dementia among persons aged 65 and over is $8.3^{2}$ ). The prevalence of dementia gradually increases as persons get older, with the highest rate of 29.4 percent being for those aged 80 and over. Overall, the prevalence of dementia is higher for women than for men(see Table 3-15).

[^1]Table 3-15. Prevalence Rate of Dementia

| (Persons) | $(2,788)$ | $(1,084)$ | $(844)$ | $(448)$ | $(409)$ |

## 3) Activities of Daily Living

As for daily living activities, 31.9 percent of older persons have at least one difficulty in activities of daily living and 3.5 percent have difficulties in all 6 items(see Table 3-17). 70~90 percent of respondents answered, by each item, that they were able to maintain their daily lives without assistance. Among the 6 items, the highest proportion of older persons have difficulties in walking(26.7 percent), the second highest in sitting(25.1 percent), and the third highest in eating(3.9 percent).

There are substantial gender differences in difficulties of Activities of Daily Living. 38.3 percent of female elderly have at least one difficulty in ADL. Among male elderly, 21.1 percent have at least one difficulty in ADL. Specifically, female elderly have more difficulty in 'walking' and 'sitting'. Also, we can observe that the rate increases rapidly as the respondents get older.

## 4) Instrumental Activities of Daily Living

Regarding instrumental daily living activities, 43.4 percent of older persons have at least one difficulty in instrumental activities of daily living and 10.2 percent have difficulties in all 4 items(see Table 3-18). Among those 4 items, the highest proportion of older persons have difficulty in use of public transportation(37.7 percent). The second highest proportion is in buying living goods(28.8 percent).

| (Persons) | $(2,221)$ | (823) | $(1,398)$ | (884) | (669) | (668) |

Gender differences in IADL are much greater than in ADL. 54 percent of female elderly have at least one difficulty of IADL. This is almost twice the corresponding figure( 25.6 percent) for male elderly. Among the 4 items of IADL, female elderly have more difficulty using public transportation and in indoor activities.

## 5) Self-perception of Health Condition

More than half of older persons percept their health status to be negative(see Table 3-19). 35.3 percent responded that they are not healthy, while 23.6 percent think that they are very unhealthy. Only 5.0 percent have strong confidence in their own health and 19.6 percent feel that they are healthy. 46.0 percent of male elderly and 66.4 percent of female elderly evaluate their health condition as negative. This indicates that more women than men tend to evaluate their health status as unfavorable.

## E. Care for Older Persons

## 1) Financial Care

69.0 percent of older persons answered that they are completely or partially dependent on other persons for at least one of the six items.

The average number of financial providers for living expenses is 1.8 persons. Of the main providers, the first son and/or daughter-in-law is the highest proportion(46.8 percent), followed by sons and/or daughters-in-laws (20.4 percent), daughters and/or sons-in-laws(16.4 percent), unmarried children(6.8 percent), and others( 9.7 percent). Therefore, it can be said that children are the main financial caregivers for older persons in Korea(see Table 3-20).

## 2) Physical Care

## A. Chronic Diseases

Among older persons who have at least one chronic disease, 37.3 percent receive physical care(see Table 3-21). More male elderly(43.1 percent) than female elderly(34.4 percent), and more married elderly(40.7 percent) than unmarried elderly(34.1 percent) receive physical care for chronic diseases. The higher the age of the respondent and the lower their educational attainment, the higher the care-receiving rate becomes. Compared to older persons living alone, older persons that live with their children(46.3 percent) or only with their spouse(42.8 percent) have higher care-receiving rates.

| Marital Status |  |  |  |  |  |  |  |
| Married | 47.9 | 20.3 | 16.0 | 4.4 | 11.4 | 100.0 | ( 865) |
| Unmarried | 45.3 | 20.6 | 17.0 | 9.9 | 7.3 | 100.0 | ( 661) |
| Educational Attainment |  |  |  |  |  |  |  |
| Illiterate | 46.0 | 23.0 | 15.2 | 4.4 | 11.5 | 100.0 | ( 465) |
| No Formal Education but Literate | 50.0 | 18.3 | 16.6 | 3.5 | 11.8 | 100.0 | ( 406) |
| Primary School Graduates | 47.2 | 18.5 | 17.0 | 8.5 | 8.8 | 100.0 | ( 451) |
| Middle \& High School Graduates | 42.2 | 21.7 | 17.9 | 14.9 | 3.3 | 100.0 | ( 172) |
| College School Graduates and Over | 38.5 | 28.6 | 15.7 | 15.9 | 1.3 | 100.0 | ( 32) |
| Living Arrangements |  |  |  |  |  |  |  |
| Older Persons | 37.1 | 12.3 | 21.6 | 0.6 | 28.4 | 100.0 | ( 230) |
| Living Alone |  |  |  |  |  |  |  |
| Elderly Living with Spouses Only | 52.3 | 17.8 | 16.9 | 2.1 | 10.9 | 100.0 | ( 287) |
| Elderly Living with their Children | 48.1 | 23.7 | 15.2 | 10.2 | 2.9 | 100.0 | ( 939) |
| Others | 38.2 | 13.8 | 13.8 | 0.9 | 33.4 | 100.0 | ( 70) |

We can observe that the main caregivers are family members. Specifically, spouses(43.9 percent) usually play the most important role in providing physical care for older persons. The proportion for the first son and/or daughter-in-law is 23.4 percent, followed by other sons and/or daughters-in-law(14.4\%). The percentages of daughters and/or sons-in-law and unmarried children are 9.8 percent and 2.5 percent, respectively.

As the age of the respondents increase, the percent of spouses as main caregiver decreases. Among older persons 75 and over, only 24.4 percent, which is much lower than the 64.6 percent for the $65 \sim 69$ age group, answered that the spouse is the main caregiver. Upon examination of the distribution of main caregivers by gender, we can see that the main caregivers for the majority of male elderly are their spouses( 87.9 percent). On the other hand, female elderly primarily depend on their children. 34.6 percent depend on their first son and/or daughter-in-law, 20.9 percent depend on other sons and/or daughters-in-law, and 14.9 percent depend on daughters and/or sons-in-law, while only 16.8 percent depend on their spouses.

## B. Activities of Daily Living

708 persons or 31.9 percent of older persons have at least one difficulty in the 6 ADL items. Out of 708 persons, 37.3 percent receive care in daily life(see Table 3-22). 46.4 percent answered that they do not need any assistance in daily life although they have some difficulty in ADL, while 16.3 percent do not receive any assistance in spite of their need for help. The average number of caregivers is estimated to be 1.4 persons.

Table 3-23 shows that the percentage of non-family members as the main caregiver for ADL is small. The proportion of spouses is highest at 34.2 percent, followed by the first son and/or daughter-in-law( 22.7 percent), and other sons and/or daughters-in-law (14.8 percent). The proportion of spouses is lower for chronic diseases.

| Unmarried | 0.0 | 36.6 | 21.6 | 15.6 | 7.2 | 8.8 | 6.4 | 3.8 | 100.0 | (157) |

## C. Instrumental Activities of Daily Living

Out of 957 persons who have at least one difficulty out of the 4 IADL items, 65.5 percent receive care. This rate is much higher than in $\operatorname{ADL}(37.3$ percent). 23.9 percent answered that they "do not need any assistance," while 10.7 percent do not receive any assistance despite their need for it(see Table 3-24). The average number of caregivers is estimated to be 1.6 persons.

The proportion of non-family members as main caregivers(8.3 percent) is greater than that of ADL. However, as for chronic diseases and ADL, the main caregivers are also family members. In particular, the highest proportion is the first son and/or daughter-in-law(27.7 percent) followed by spouses(24.5 percent), and other sons and/or daughters-in-law(16.0 percent).

The proportion of daughters and/or sons-in-law is higher in urban $\operatorname{areas}(12.8$ percent) than rural areas ( 5.0 percent). The proportion of spouses is lower and of children is higher among female elderly compared to male elderly in all three dimensions of physical care. Also, the proportion of spouses decreases as the respondents' age increases(see Table 3-25).

## 3) Emotional Care

Emotional care is measured by whether older persons have persons to consult with or not during times of difficulty. 77.6 percent of the respondents receive emotional care and the average number of consultants is 2.1 persons. Compared to financial and physical care, the average number of caregivers here is greater(see Table 3-26).

The highest proportion of main caregivers is spouses (32.9 percent), followed by first son and/or daughter-in-law (21.4 percent), friends and/or neighbors(16.8 percent), and daughters and/or sons-in-law(14.1 percent). Compared to financial and physical care, the roles of friends and/or neighbors and daughters and/or sons-in-law in emotional care are greater. This results in diversification of main caregivers in terms of emotional care.

Male elderly depend on their spouses not only for physical care but also for emotional care. The proportion of spouses that provide emotional care to female elderly is only 15.0 percent, though. The highest proportion is first son and/or daughter-in-law(24.4 percent) followed by friends and/or neighbors(20.9 percent), and daughters and/or sons-in-law(20.6 percent).

## F. Care by Older Persons

## 1) Financial Care

## A. Giving Financial Care

Older persons not only receive care but also give care to others. 26.5 percent of older persons give financial support to other people. Table 3-27 reveals that there are large differences by area. 35.0 percent of older persons who are living in rural areas answered that they give financial support(including both cash and in-kind) to others, which is much higher than urban
residents(21.0 percent). This may be due to the fact that rural elderly have a variety of products to give to others. More male elderly(31.1 percent) than female elderly(23.7 percent), and more married elderly(32.1 percent) than unmarried elderly(20.8 percent) give financial support to others. As the respondents become older, the financial care giving rate becomes lower. The average number of financial care receivers is estimated to be 1.8 persons.

We can observe the distribution of receivers of main financial care from older persons in Table 3-27. Major care receivers include first son and/or daughter-in-law(30.0 percent), followed by grandchildren and/or spouses ( 25.1 percent), other sons and/or daughters-in-law(10.1 percent), daughters and/or sons-in-law(9.1 percent), unmarried children(8.9 percent), and charity to social organizations( 8.8 percent). The rate of the rural elderly who give financial care to their first sons is much

| Male | $100.0(823)$ | 31.1 | 36.3 | 12.9 | 9.5 | 12.1 | 3.9 | 7.2 | 8.0 | 100.0(234) |
| Female | 100.0(1,398) | 23.7 | 25.4 | 8.0 | 8.8 | 6.5 | 33.3 | 10.0 | 8.0 | 100.0(324) |
| Marital Status |  |  |  |  |  |  |  |  |  |  |
| Married | 100.0(1,117) | 32.1 | 37.2 | 12.7 | 9.2 | 10.3 | 14.1 | 7.6 | 8.8 | 100.0(333) |
| Unmarried | 100.0(1,104) | 20.8 | 19.3 | 6.2 | 8.9 | 6.7 | 41.4 | 10.6 | 6.9 | 100.0(225) |

higher(45.4 percent) than in urban areas(13.8 percent); compared to other sons and/or daughters-in-laws, the differences between rural and urban areas is larger. The rate of male elderly who give financial care to their first sons is much higher(36.3 percent) than that of female elderly(25.4 percent). The rate of older persons who give financial care to their grandchildren is relatively high, especially for rural elderly. However, it is presumed that this amount of financial support is not that large when compared to the children.

## B. Inheritance

Table 3-28 reveals that 17.8 percent of older persons have already left their property to their children(including 5.2 percent of older persons who have left a portion of their property). 33.2 percent of the respondents answered that they have not left their property to their children yet, while 44.4 percent do not have any property to leave.

The proportion of the rural elderly who have no property to leave is higher than that of the urban elderly. As the age of the respondents increases, so does the rate of those who have already left all their property or have no property to leave. The same trends are observed among the female elderly. Also, the lower the educational attainment of the older person, the higher the rate of respondents who do not have any property.

## 2) Emotional Care

More than half of older persons(55.6 percent) give emotional care and advice to others(see Table 3-29). This rate is much higher than the 26.5 percent in financial care, but lower than the 77.6 percent of emotional care-receiving. As the respondents' age increases, the emotional care-giving rate decreases which is the same as seen in the emotional-care receiving rate. More male elderly( 63.1 percent) than female elderly( 51.2 percent), and more married elderly( 66.5 percent) than unmarried elderly $(17.8 \%$ ) give emotional support to percent others.

The average number of care receivers among 1,232 persons surveyed who give emotional support to others is 1.9 persons. The highest proportion of emotional care receivers is friends and/or neighbors(51.7 percent), followed by spouses(39.6 percent), first sons and/or daughters-in-law(28.7 percent), and daughters and/or sons-in-laws(25.5 percent).

Table 3-28. Inheritance by Characteristics of Older Persons

| Characteristics | Left All Property | Left Part of Property | Has Not <br> Left <br> Property <br> Yet. | $\mathrm{N} \quad 0$ <br> Intention <br> to Leave | $\mathrm{N} \quad 0$ Property <br> to Leave | $\begin{array}{lr} \mathrm{N} \quad 0 \\ \text { Children } \end{array}$ | Total | (Person) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Total | 12.6 | 5.2 | 33.2 | 1.4 | 44.4 | 3.2 | 100.0 | $(2,220)$ |
| Area |  |  |  |  |  |  |  |  |
| Urban | 10.1 | 4.6 | 29.1 | 1.8 | 50.4 | 4.1 | 100.0 | $(1,406)$ |
| Rural | 17.0 | 6.2 | 40.3 | 0.5 | 34.2 | 1.8 | 100.0 | ( 814) |
| Age |  |  |  |  |  |  |  |  |
| 65~69 | 6.4 | 5.8 | 42.8 | 2.6 | 39.6 | 2.9 | 100.0 | ( 884) |
| 70~74 | 11.3 | 4.6 | 34.3 | 0.6 | 46.3 | 2.9 | 100.0 | ( 668) |
| $75^{+}$ | 22.2 | 5.0 | 19.3 | 0.5 | 48.9 | 4.1 | 100.0 | ( 668) |
| Gender |  |  |  |  |  |  |  |  |
| Male | 7.0 | 6.7 | 48.2 | 2.3 | 34.3 | 1.5 | 100.0 | ( 823) |
| Female | 15.9 | 4.3 | 24.3 | 0.8 | 50.4 | 4.3 | 100.0 | $(1,397)$ |
| Marital Status |  |  |  |  |  |  |  |  |
| Married | 5.8 | 7.4 | 48.8 | 2.2 | 34.9 | 0.9 | 100.0 | $(1,116)$ |
| Unmarried | 19.6 | 2.9 | 17.4 | 0.5 | 54.1 | 5.6 | 100.0 | $(1,104)$ |

The older the respondents are, the lower the proportion with a spouse and unmarried children. This is due to demographic factors such as the death of a spouse or marriage of children. The proportion of friends and/or neighbors, however, is stable with age. While female elderly give emotional care to various persons including their spouses(15.4 percent), friends and/or neighbors(40.1 percent), and daughters( 15.0 percent), male elderly mainly care emotionally only for their spouses(53.8 percent). Also, differences can be observed by marital status. A large proportion of married elderly provide emotional care for their spouses(53.9 percent), while unmarried elderly provide care for their friends and/or neighbors(49.3 percent).

## G. Social Activities

Participation in religious activities is highest at 52.7 percent, followed by social activities( 28.8 percent). These are the highest among religious activities, social activities, cultural activities, sports activities, volunteering, attending elderly college, and others(see Table 3-30). Generally speaking, social activities of older persons are limited because they do not have the resources or opportunities to enjoy social and leisure activities.

Both the participation rates of religious activities and social activities are higher in urban areas. The participation rate of religious activities is higher for female elderly( 62.6 percent) than for male elderly but is lower for social activities(20.2 percent).

Although the participation rate of religious activities is stable by age, the participation rate of social activities rapidly decreases as the respondents become older. Also, the participation rate of social activities is sensitive to household income and that of religious activities is not.

## H. Social Welfare Needs

## 1) Awareness and Utilization Rates of Welfare Policies for Older Persons ${ }^{3}$ )

19.2 percent of the respondents were aware of the policy for Old Age Allowance and 6.8 percent of older persons were covered as of May 1998. After being told about the Old Age pension though, 61.9 percent expressed the wish to receive it, after its replacement of the Old Age Allowance in July 1998. The awareness rate of the Elderly Workplace and Elderly Job Placement Centers are also quite $\operatorname{low}(16.0$ percent and 15.1 percent, respectively). Few older persons have actually utilized

[^2]Table 3-30. Social Activity Participation of Older Persons

| $150 \sim 249$ Million | 59.0 | 36.4 | - | 5.2 | 1.4 | 0.2 | 2.9 |
| 250 Million ${ }^{+}$ | 51.6 | 47.6 | 1.4 | 6.0 | 2.2 | 3.0 | 7.0 |

them, while 23.6 percent and 15.5 percent, respectively want to utilize them in future(see Table3-31).

While the awareness rate of Free Elderly Cafeterias is relatively high(39.9 percent), only 5.8 percent have used it. 17.8 percent want to use it in the future.

Only few( 0.7 percent) older persons have utilized Geriatric Hospitals and only 20.6 percent know about them. 40.1 percent of the respondents expressed their future willingness to use it though. This shows us the latent need for Geriatric Hospitals. On the other hand, almost all older persons(97.2 percent) know about Health (Sub)Centers which provide health/medical services to the public. 68.8 percent have utilized Health (Sub)Centers and 67.2 percent expressed their future willingness to use it.

Regarding Elderly Activity Centers, the most popular leisure center for older persons, 95.4 percent of older persons are aware
of them. Also, almost half of older persons have used them and want to use them in the future( 47.6 percent and 45.8 percent respectively). The awareness rate for elderly colleges or schools is high(74.5 percent) but the utilization rate( 9.1 percent) and the proportion of older persons who want to use them in the future(18.2 percent) is relatively low.

Table 3-31. Awareness and Utilization Rates of Welfare Policies for Older Persons
(Unit: \%)

|  | Awareness <br> Ratio | Utilization Rate |  | Want to Use in the Future | Satisfaction |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Health (sub)Center | 97.2 | 24.1 | 40.7 | 67.2 | 59.0 | 29.9 | 11.1 | 100.0 | $(1,428)$ |
| Elderly Activity Center | 95.4 | 28.1 | 19.5 | 45.8 | 58.4 | 27.6 | 14.0 | 100.0 | $(1,051)$ |
| Elderly College/ School | 75.4 | 2.0 | 7.1 | 18.2 | 63.7 | 25.5 | 10.8 | 100.0 | ( 198) |
| Community Elderly Welfare Center | 42.1 | 2.3 | 3.3 | 21.6 | 58.6 | 31.6 | 9.8 | 100.0 | ( 125) |
| Free Elderly /Nursing Home | 61.0 | - | - | 13.7 | - | - | - | - | - |
| Low-cost Elderly/Nursing Home | 31.0 | - | 0.1 | 6.7 | - | - | - | - | - |
| Charged Elderly/Nursing Home | 53.4 | - | - | 5.7 | - | - | - | - | - |
| Exemption of Inheritance Tax(Residential) | 14.1 | - | 0.2 | 11.6 | - | - | - | - | - |
| Exemption of Inheritance Tax(Personal) | 12.0 | - | 0.1 | 10.1 | - | - | - | - | - |

The awareness rates of free, low-cost, and charged elderly and nursing homes are 61.0 percent, 31.0 percent, and 53.4 percent, respectively. Few elderly have experienced using elderly and nursing homes. However, 13.7 percent, 6.7 percent, and 5.7 percent, respectively, of older persons wish to use them.

Only few are aware(14.1 percent and 12.0 percent) of the Exemption of Residential Inheritance Tax and Personal Inheritance Tax, and few actually benefit from those exemptions. The proportion that wants to use them in the future is $\operatorname{low}(11.6$ percent and 10.1 percent, respectively).

## 2) Social Care Services

There are three components to social care services including home help services, day care centers for older persons, and short-term care centers. Regarding home help services, 18.5 percent of older persons know about the services, and the rate in urban areas is higher than in rural areas(11.7 percent). While only 0.6 percent have used them, 25.2 percent want to use them in the future. However, 15.9 percent of the 25.2 percent only want to use the services if they are free(see Table3-32).

Regarding day and short-term care centers for older persons, only few actually know about them( 2.0 percent and 1.8 percent) and none have experienced using them. 18.2 percent and 15.7 percent want to use them in the future.

## 3) Housing Needs

Regarding special housing for older persons, 33.6 percent of older persons said they will live there if they are constructed(see Table3-33). The rate in urban areas( 39.0 percent) is higher than in rural areas( 24.3 percent). The rate is also higher among the 65 $\sim 69$ age group( 41.6 percent), compared to 33.2 percent for the $70 \sim 74$ age group and 23.3 percent for the 75 year old and over
age group. The majority favored quiet rural areas for the special housing.

Table 3-33. Special Housing for Older Persons by Area and Age

| (Unit: \%) |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Want |  |  |  |  | Does <br> Not <br> Want | Total (Person) |
|  | Sub- <br> total | Urban <br> Areas | Suburban Areas | Near <br> Famous Resort Areas | Rural Areas |  |  |
| Total | 33.6 | 6.8 | 9.1 | 1.0 | 16.7 | 66.4 | 100.0 (2,208) |
| Area |  |  |  |  |  |  |  |
| Urban | 39.0 | 9.4 | 12.4 | 1.1 | 16.1 | 61.0 | 100.0 (1,395) |
| Rural | 24.3 | 2.3 | 3.3 | 0.8 | 17.9 | 75.7 | 100.0 ( 813) |
| Age |  |  |  |  |  |  |  |
| $65 \sim 69$ | 41.6 | 7.5 | 12.5 | 1.0 | 20.6 | 58.4 | 100.0 ( 879) |
| $70 \sim 74$ | 33.2 | 7.2 | 8.1 | 1.4 | 16.5 | 66.8 | 100.0 ( 665) |
| 75+ | 23.3 | 5.3 | 5.6 | 0.6 | 11.9 | 76.7 | 100.0 ( 663) |

Among older persons who live alone or only with their spouses, 27.2 percent, including the 14.6 percent which only want to use free facilities, want to live in elderly/nursing homes when they are not able to live alone(see Table3-34). This rate is higher in urban areas( 35.0 percent) than in rural areas(17.2 percent). Also, the rate is higher as the age of the respondents increase or with higher educational attainment. In case of charged facilities, those who have more income tend to show a higher willingness to live there.

Among the reasons older persons do not want to live in the elderly/nursing homes are "the objection of children"(33.5 percent) which shows the highest proportion, followed by "bad perception of facilities"(28.4 percent) and they are "too expensive"(23.0 percent).

| 250 Million Won and Over | - | - | - | 100.0 | 100.0 | ( 10) |

## I. Perception and Attitudes towards Care by Their Children

## 1) Children's Responsibility for Older Parents

Regarding children's responsibility for older parents, 46.0 percent of the respondents think that first sons have to care for their parents, followed by 27.5 percent who say that it is the 'capable children's responsibility' and 16.0 percent who say it is the responsibility of the "parents themselves"(see Table3-35). Including 'the first son' and 'sons', 55.6 percent of older persons think that it is the son's responsibility to take care of their parents. This indicates that the patriarchal ideology is still prevalent among older persons. This rate of 'the first son' and 'sons' is even higher in rural areas. Also, the rate is higher as the respondents' age increases or with lower educational attainment.

## 2) Financial Support for Old Parents

As the ideal method to preparing living expenditures for later in life, 38.8 percent answered that they have to prepare for themselves, 32.5 percent said "the family has to support them" and 25.5 percent said the "social welfare system" should. The rate of "self-support" is higher among the female elderly(32.3 percent) than among male elderly(49.8 percent). Also, the rate becomes higher as the age increases or with lower educational attainment(see Table 3-36).

## Chapter 4. Policies and Programmes Related to Older Persons

## A. Major Social Welfare Policies

## 1) Present Status of the National Pension Scheme

Public Pension programmes, public assistance based on the Livelihood Protection Law, and old age allowance are three components of public policy that aim at enhancing the economic security of the elderly in Korea.

There are four public pension programmes, all designed as contributory social insurance schemes. Three are for people employed in particular occupations. The government employees pensions was instituted in 1960, the military personnel pension was instituted in 1963 and the private school teachers pension was instituted in 1975. The National Pension scheme was instituted in 1988 for people employed in workplaces with 10 or more employees.

Table 4-1. Public Pension Programmes

| Programmes | Year Started | Coverage |
| :--- | :---: | :--- |
| National Pension | 1988 | Employees and <br> self-employed persons |
| Government Employees Pension | 1960 | Government officers, <br> police, law officers, etc. |
| Military Personnel Pension | 1963 | Tenured military sergeants |
| Private School Teachers Pension | 1975 | Private school teachers |

The National Pension scheme, the main public pension programme in Korea, provides financial security against aging, disability and death. Although the Korean government planned to amend the 'National Welfare Pension Act' in 1973 and to introduce the pension scheme in 1974, it was indefinitely postponed due to economic obstacles. In 1986, the 'National Pension Act' was finally amended and became effective in 1988 in work places with 10 or more employees. Afterwards, in 1992, coverage was expanded to work places with 5 or more employees.

National Pension provision was expanded to rural areas in 1995. Insured persons are workers between ages 18 to 59 in employment such as farming, forestry, livestock, or the fishery industry. Under a special provision, those between the ages of 60 to 65 years old can also apply for pension before they reach the age of 71. The fact that all this was achieved in only seven years from the time the pension scheme was first introduced, shows remarkable progress.

After expansion of the National Pension Scheme to rural areas, the total number of insured drastically increased from $5,450,000$ in 1994 to $7,870,000$ in 1997. At that point, the National Pension covered 56.9 percent of the total population. The National Pension Scheme extended its coverage to urban self-employed residents in 1999.

Table 4-2. Number of Insured Persons in the National Pension Scheme by Sector

|  |  |  |  | (Unit: 1,000 persons) |  |
| :--- | :--- | :---: | :---: | :---: | :---: |
|  | Total | Salary <br> Workers | Local | Voluntary <br> Affiliation | Voluntary Continuing <br> Affiliation |
| 1993 | 5,160 | 5,109 | - | 40 | 11 |
| 1994 | 5,445 | 5,383 | - | 48 | 14 |
| 1995 | 7,496 | 5,542 | 1,890 | 49 | 16 |
| 1996 | 7,829 | 5,678 | 2,085 | 50 | 16 |
| 1997 | 7,836 | 5,601 | 2,085 | 47 | 102 |
| Source: | National Pension <br>  Corporation, | National | Pension | Statistical |  |
|  | Yearbook, each year. |  |  |  |  |

Most public pension programs are expected to show deficits in the future. Thus, financial adjustments will be necessary in cases where the financial disparity originates from structural factors, such as age structure, ability to pay, and so on. As a result of the growth in the number of pension beneficiaries, pension expenditures are increasing rapidly, and this will become significant as the Korean government attempts to establish an equitable pension system. Indeed, if the National Pension Scheme continues to be operated the way it has, the reserve funds will likely be exhausted by the year 2033. Therefore, a mid and long-term financing plan must be prepared.

## 2) Present Status of Public Assistance

Public assistance, or the so-called Livelihood Protection system, is based on the Livelihood Protection Act which was enacted in 1961 and amended in 1982 and 1997. Public assistance aims to eradicate poverty directly by guaranteeing a minimum standard of living and enhancing the self-reliance capabilities of the poor. Livelihood Protection recipients are those who have no one to support them, or whose household members cannot provide for them without assistance. Specifically, they include older persons who are unable to support themselves, children under 18, expectant women, people unable to work due to disease or mental and/or physical disability, other poor persons who are qualified to receive assistance under the Livelihood Protection Act, and mothers with children under 18 and who need protection for themselves and their dependent children. Livelihood Protection recipients are selected annually by local governments based on the income and property criteria set up by the Ministry of Health and Welfare.

The types, content, and methods of Livelihood Protection vary according to the type of recipient. To be eligible for Home Care, one must be unable to work, or live in a household comprised solely of women over 50 or of persons unable to work. Contents of protection for Home Care recipients include livelihood aid, self-support aid, educational aid, maternity and
burial benefits, and medical care. Institutional Care recipients are those who are legally qualified to receive Home Care but do not have their own home or are unable to live in their own home. Although the benefit coverage of Home care and Institutional Care are the same, the benefit amount varies. Self-support Care recipients are those who are eligible for Livelihood Protection but fail to meet the requirements for Home or Institutional Care. The types of protection for Self-support Care recipients consist of health care, self-support aid, and educational aid. Home Care and Institutional Care recipients lack the ability to work, while Self-support Care recipients are able to work but lack sufficient resources. Since the economic crisis, the unemployed lower classes and their family members have been provided coverage by Livelihood protection under the title of Temporary Livelihood protection(see Table 4-3).

Table 4-3. Eligibility and Contents by Type of Livelihood Protection

| Types | Eligibility Criteria |  | Contents |
| :---: | :---: | :---: | :---: |
|  | Monthly Income/Person | Property/Household |  |
| Home Care | below 230,000 Won | below 29 Million Won below 44 Million Won (in case of Temporary Livelihood protection) | livelihood, self-support, educational, maternity, burial, medical aid |
| Self-Support Care |  |  | self-support, educational, medical |
| Institutional Care |  |  | livelihood, self-support, educational, maternity, burial, medical aid |
| Source: Ministry <br>  1998. | of Health and | Welfare, Guidelines | for Livelihood Protection, |

In 1998, Livelihood Protection recipients included 1,175,187 persons which is 2.6 percent of the total population. Compared to the total population, the rate of older persons is much higher; 8.2 percent of older persons(251,094 persons) were Livelihood Protection recipients in 1998(see Table 4-4).

Table 4-4. Proportion of Recipients
(Unit: Persons, \%)

|  | Total Population | Older Persons |

| \% of Recipients | 2.6 | 8.2 |
| Source: | Ministry of | Health |
| and Welfare, Analysis of |  | Livelihood |
| Protection Recipients, 1998. |  |  |

## 3) Present Status of Health Insurance

The National Health Insurance program is composed of three different schemes: 'Industrial Health Insurance Funds' for industrial workers(145 associations in 1998); a 'government health insurance fund' for government employees and private school teachers, and 'Regional Health Insurance Funds' for rural and urban self-employed workers(227 associations in 1998). Most funds are legally independent in terms of both administration and finance. The National Federation of Medical Insurance plays an important role in examining invoices from medical care institutions and in paying them.

Premiums for industrial and government funds are imposed at a rate proportional to the insured's monthly earnings, while for the regional insurance funds, several factors such as income, value of real estate and household size are taken into account in calculating the premiums. For financing of regional funds, the government provides subsidies most of which are allocated by capitation. A portion of the subsidies are distributed to the funds in different amounts depending on the amount of taxable income and the elderly's dependency ratio of each fund.

## 4) Health and Medical Policies

At present all Koreans are covered by health insurance or medical assistance programs. As of 1995, 96.7 percent of those aged 65 and over were covered by health insurance and the rest
of the elderly were covered by medical assistance. In spite of the high coverage of health insurance, the increasing medical expenditures due to the aging population have still become a major concern for Koreans. Older persons comprise 6.1 percent of the population covered by health insurance, but 13.1 percent of health insurance costs were used for older persons in 1996. Also, the medical costs per elderly person aged 65 and over are approximately 2.1 times the costs of citizens under age 64. Therefore, the high medical costs resulting from population aging have become a serious issue.

Table 4-5. Trends of Medical Expenditure Increase

|  |  |  | (Unit: Million Won, \%) |  |
| :---: | :--- | :---: | :---: | :---: | :---: |

Currently, benefits for medical examinations, drugs, surgery, nursing, ambulances, and check-ups are provided. Generally speaking, health insurance coverage is more focused on curative rather than preventive health care.

Also, patients have to pay 20 percent of hospitalization fees, and certain rates of outpatient fees( 30 percent for clinic, 40 percent for hospital, 50 percent for general hospital). These high percentages of out-of-pocket payments have led to financial burdens for patients, especially the elderly and the poor.

There was also limitation of the reimbursable treatment period per year. Only since 1996 was the limitation of the reimbursable treatment period per year overruled for the disabled and the elderly. This extension of the reimbursable treatment
period will provide more treatment opportunities for the chronically ill and the elderly, who need more medical care and longer treatment. The current limit on duration is 270 days a year, except for the disabled and the elderly. This limit will gradually be extended every year until it finally reaches 365 days a year by the year 2000 .

## B. Development of Welfare Policies for Older Persons ${ }^{4}$ )

## 1) Development of Welfare Policies

The Welfare Law for older persons was enacted June 5, 1981 to establish legal grounds for the improvement of welfare for older persons. The law was amended in 1990, 1993, and 1997. The law is based on three basic principles. First, older persons who have devoted themselves to bringing up their children and to developing society and nation, should be guaranteed a sound and stable life with dignity. Second, older persons should be guaranteed opportunities for jobs, depending on their ability, and for participation in social activities. Third, older persons themselves should try to maintain their health and to contribute to social development through effective utilization of their knowledge and experiences. Following this law, various welfare programmes have been developed and expanded(see Table 4-6).

[^3]Table 4-6. Welfare Programmes and Policy Development of Older Persons

| Year | Programmes and Policy Development |
| :--- | :--- |
| 1980 | Special Treatment Programme for Older Persons Established |
| 1981 | Welfare Law for Older Persons Enacted |
| 1981 | Elderly Job Bank Implemented |
| 1982 | Special Treatment Programme for Older Persons Expanded |
| 1982 | Charter of Respect for Older Persons Promulgated |
| 1983 | Free Health Check-up Programme for Older Persons Implemented |
| 1986 | Elderly Workplace Program was Started |
| 1990 | Division of Welfare for Older Persons Established |
| 1990 | Welfare Law for Older Persons Amended |
| 1990 | Old Age Allowance Provided to Low-Income Elderly |
| 1991 | Elderly Employment Promotion Programme |
| 1998 | Old Age Pension Provided for Low-income and Lower Middle |
|  | Class Elderly |

The division of Elderly Welfare in the Ministry of Health and Social Affairs was established November 1990.

Figure 4-1. Organization of the Ministry of Health and Welfare

## 2) Budget for Older Persons

The Korean government has put a great deal of effort into developing elderly welfare policies to prevent social problems caused by the aging of society, to improve the social status of the elderly and to guarantee livelihood security of the elderly in an aging society. According to Table 4-7, however, in spite of the effort to increase expenditures on welfare policies for the elderly, the proportion of Welfare Expenditures for the Elderly was only 5.4 percent of the Ministry of Health and Welfare Expenditures for 1999. Also, 78.3 percent of expenditures on the programs and policies for the elderly is for the Old Age Pension and another 13.0 percent is for institutional care(see Table 4-8). Therefore, expenditures on leisure activities and health and medical care for the elderly compose only a small portion of the expenditures for elderly. The proportion of the expenditures for home care services is also very small.

Table 4-7. Budget of Korea, 1990~1998

## C. Policies for Older Persons

## 1) Policies for Economic Secuity

## A. Old Age Allowance

An old age allowance was provided to poor elderly persons since 1991 as a Special Scheme to Guarantee a Minimum Standard of Living. The allowance system only covered a limited number of elderly though, and its level was also deemed insufficient. At first, an allowance of only 10,000 Won a month was provided to the elderly under Livelihood Protection who were 70 years of age or over. The government therefore, expanded the allowance to the elderly under Livelihood Protection who were
between 65 to 79 years of age(228,477 elderly) by providing them with 35,000 Won a month, and to the elderly under Livelihood Protection aged 80 years and over(36,642 elderly) by providing them with 50,000 Won a month in 1997. In spite of expansion of the National Pension Scheme, most of the population aged 65 and over remained uncovered. Therefore, the old age pension came to replace the old age allowance to enhance the self-reliance capabilities of the elderly poor, with the amendment of the "Welfare Act for the Elderly" in 1997. The new old age pension system started July 1998.

The new system was devised upon considering the fact that the previous welfare policy for the elderly was limited to the elderly under Livelihood Protection, and only provided them with indirect support.

Persons that are eligible for Old Age Pension must be a Livelihood Protection Recipient who are 65 years of age or over(Elderly Welfare Act, Article 9, Clause 1) and must be below the government's minimum income and asset level(Elderly Welfare Act, Article 9, Clause 2), without being a public pension recipient.

The income level is below 60/100 of the average monthly income for urban laborer households. This amount is the monthly average income per person which is achieved by dividing the number of household members by the total monthly income of the beneficiary, his/her spouse and supporter.

The asset level is 140 percent below the asset level established for Self-care Protection Recipients under the Livelihood Protection Act. The asset amount is the value of total assets possessed by beneficiaries, his/her spouse and supporter.

The Social Pension Benefit Level for Livelihood Protection elderly is 50 thousand Won for persons 80 years of age or more, 40 thousand Won for elderly between 65 and 80 years of age, 20 thousand Won for general low-income elderly, and for a married couple the benefits for each spouse are reduced by 25 percent resulting in benefits for each person of 15 thousand Won.

Table 4-9. Eligibility for Old Age Pension Recipients

|  | Income Level | Asset Level |
| :--- | :--- | :---: |
| Eligibility | Less than 60/100 of the <br> average monthly income <br> for urban laborer <br> households in the <br> previous year | $140 \%$ below asset eligibility <br> level for Self-care Protection <br> recipients |
| Actual Eligibility <br> $(1998)$ | $1,372,200$ Won | $40,600,000$ Won |

The total budget is estimated at 1.084 trillion Won, with .742 trillion Won(68.5 percent) being for general account estimates and . 342 trillion Won(31.5 percent) being provided by regional self-governing groups ${ }^{5}$ ).

Source: Ministry of Health and Welfare, Elderly Welfare Department, 1998.
As of August 1998, Social Pension provided benefits to a total of 658,000 recipients, which included 243,446 (37.6 percent) Livelihood Protection elderly, 414,554(63.0 percent) general low-income persons, and others. This covered 21.6 percent of total elderly persons over the age of 65 .

[^4]
## B. Policies to Enhance Employment Opportunities

Establishing income maintenance, including financial support for the elderly, is one of the most important social welfare policies for the elderly. There are three job placement programs that provide elderly people with opportunities to earn money by making use of their free time. These programs are the Elderly Job Placement Center, Elderly Workplace and Elderly Employment Promotion (based on the Employment Promotion Law).

The Elderly Job Placement Center(formerly the Elderly Job Bank) was started in 1981 to provide older persons with leisure time and opportunities to earn money. In 1998, 70 centers were being operated by local branch offices of the National Association of Senior Citizens. The government supports 70 banks with 450,000 Won per month per center in operational expenses.

The Elderly Workplace program was started in 1986 and 511 workplaces were being operated by voluntary organizations with government assistance in 1998. The government supports workplaces with 6 Million Won per center in essential construction fees(central government 50 percent, local government 50 percent).

The government has also established Elderly workplaces in elderly welfare centers, including elderly activity centers. These workplaces provide older persons with work depending on their aptitude and capability, enable older persons to spend leisure time at workshops, and opportunities to earn income.

The Employment Promotion Law, enacted in 1991, encourages business firms to employ 3 percent or more of its employees from among the population aged 55 and over. In addition, this law stipulates that 60 occupation categories(selling bus tokens and cigarettes, attending parking lots and public parks, etc.) should be preferentially allocated to older persons.

## 2) Policies for Healthy Life

## A. Free Health Examinations

To prevent and diagnose geriatric diseases at an early stage, check-ups are provided for older persons covered by health insurance. Also, free Health Examinations are provided to older persons under Livelihood Protection. Free health examinations were extended to various geriatric diseases including diabetes and cataracts in 1992. In 1996, they were also expanded from general examinations that included blood and X-ray examinations to including special geriatric diseases such as cancer, depending on the demand of the elderly. As a result, health examinations have become more effective.

The budget for free health examinations was 370 million Won(central government: 252 million Won; local government: 118 million won) in 1999, covering about 30,000 elderly.

## B. Special 10 Year Plan for Elderly with Dementia

As a result of the increase in number of elderly with dementia, the government has recently began devoting attention to providing them with public care services. The government plans to establish "Dementia Reporting and Counselling Centers" within every Health Center to provide community-based services. Currently, there are 14 nursing homes for the elderly with dementia who cannot be cared for within their own family or general nursing home. Also, 10 nursing homes and 9 hospitals for the elderly with dementia are under construction.

## 3) Institutional Care

The public provision of long-term care in Korea is in a very early stage. Therefore, the main policy concern now is not qualitative aspects such as autonomy, privacy, and consumer rights of the elderly, but how to respond to the increasing demand for long-term care.

As the elderly population increases, the number of frail or disabled elderly Koreans who need assistance with day to day tasks also increases. In Korea, the physical care needs of the elderly have traditionally been mostly provided by family caregivers. The concept of family care for the elderly is still prevalent, but the role of the family in supporting the elderly is no longer taken for granted. It is also becoming more difficult to take care of frail elderly people in the home. This may be due to several factors such as the changing values of family life, the nuclearization of the family, the decrease in family size, and women's increasing participation in the workplace and social activities. Based on these changes, the government has recently began devoting attention to providing public long-term care services for the elderly.

There are 7 kinds of welfare facilities for the elderly in Korea. In 1998, 10,646 people( 0.35 percent of those aged 65 and over) were cared for in 200 facilities(see Table 4-11). There are three types of welfare facilities for older persons in Korea. 4 private fee-paying nursing homes are for wealthier elderly people, 13 homes are provided by charitable groups, often at heavily subsidized prices for particular groups of the elderly, and 63 lower-quality old age nursing homes are for poor elderly people who are maintained as a form of social assistance. In sum, in 1998, 4,330 people( 0.14 percent of those aged 65 and over) were cared for in 80 nursing homes. In case of elderly homes, there are 16 private fee-paying homes, 4 low-cost homes, and 86 lower-quality free elderly homes. In 1998, 5,161 people( 0.17 percent of those aged 65 and over) were cared for in 106 facilities. The government is also building many new public homes. In addition to those, there are 14 free nursing homes for the elderly with dementia.

Table 4-11. Welfare Facilities for Older Persons in 1998

Source: Ministry of Health and Welfare, Annual Report on Welfare Facilities, 1998.

The main policies relating to long-term care are the Special 10 Year Plan for the Elderly with Dementia, special governmental subsidies for the construction of hospitals for the elderly, and the expanded construction of nursing homes. In addition to those plans, because of the growing importance of health problems due to aging, the Welfare Law for the Elderly enacted on June 5, 1981 was amended to establish legal ground for the provision of health services for the elderly.

## 4) Home Care Services for Older Persons

The Government has began to devote attention to home care services for the elderly based on the recognition of the difficulty in caring for frail elderly in the home. 52 home help service centers, 31 day care centers for the elderly and 15 short-term care centers are currently in operation. The program will receive major budgetary support, and thus is expected to increase rapidly in the coming years.

Home help services, day care centers for the elderly, and short-term care centers, are available to elderly recipients of public assistance free of charge, at reduced-cost for poor elderly, and others have to pay all costs themselves.

## 5) Polices for a Meaningful and Comfortable Life

## A. Vitalization of Elderly Activity Centers

The elderly activity center(KyungRoDang), a representative leisure facility, is supported with 44,000 Won a month in operational costs and 250,000 Won a year in heating costs, both of which come from the state government budget. There are currently 33,485 elderly activity centers. Moreover, to vitalize the activity of the centers, various programs are being developed and distributed, and ways to provide various useful information on health and welfare, job placement, health insurance, and pension in the centers are under consideration. Also, assistance in daily living such as cleaning services and meal delivery services will be provided with cooperation of women's associations and the young in the community.

## B. Establishment of Multi-purpose Senior Centers

To offer comprehensive welfare services like health counselling, culture, and recreation to the elderly, five model multi-purpose senior centers will be established within the years 1996-2000, and the centers will be expanded nationwide. Moreover, there are currently 80 Senior Citizens Centers in operation, and these will be expanded focusing on metropolitan areas.

## C. Expansion of Charged Facilities for the Middle Class Elderly

To satisfy the needs for high quality leisure and housing services of the middle class elderly, central government agencies give financial support to the private sector for participation in welfare. The government provides $5 \sim 6$ thousand million Won in loans at low interest and reduces the ordinary taxation for participation of the private sector in the construction of charged elderly homes, charged nursing homes, and hospitals for older persons. Also, the government will continue to put a great deal
of effort into encouraging welfare investment in the private sector.
D. Expansion of Opportunities for Volunteer and Social Activities

The participation rate for volunteer activities is very low due to the social environment, although some elderly people do participate in voluntary activities such as environmental protection and traffic-regulation. Volunteer activity can boost both the physical and mental health of an elder persons' life and can make later life productive and meaningful. Therefore, methods of actualizing volunteer activity through encouragement of civil activities and providing of transportation fees are under consideration.

Source: Ministry of Health and Welfare, White Paper on Health and Welfare, 1998.

## 6) Boosting Respect for the Eldenly

## A. Celebration of Elderly Week and Day of the Elderly

The government celebrates "Elderly Week" and "Day of the Elderly" on October 2 with special activities held regionally and at work places to continue and develop the spirit of respect for the elderly. In addition, the government selects and gives rewards to family members who have shown exemplary filial acts and citizens who have contributed to elderly welfare. The government also organizes sports events for the elderly and seminars on aging.

| Source:Ministry  <br>  Welfare, Health and Welfare, White |  |  |  |  |  |
|  |  |  | Paper of | Health and |  |

## B. Expansion of Senior Discount System

The senior discount system, which is aimed at promoting respect for the elderly, is applied to a total of 13 items, including public transportation fare ( 50 percent of second-class train fare, 30 percent of first-class train fare, 20 percent of ship fare, 10 percent of air fare, and free subway fare), for people aged 65 and over. A discount system which promotes respect and mitigates the economic burden of the elderly will be expanded with the cooperation of other ministries.

## Chapter 5. Conclusion

## A. Summary of the Current Situation

Korea is experiencing unprecedentedly fast population aging. It is expected that 5 working age persons(population from 15 to 64 years of age) will have to care for 1 older person( 65 years old and over) in 2022 when the old age dependency ratio will be 20.8. In 1998, the old age dependency ratio was 9.2 , or 11 working age persons for every older person. This means that caring for the elderly will become a social issue in the near future even though Korea is still unprepared.

Along with the increase in older population, the welfare needs of older persons also increase and become more diverse. First, because policies and programs to promote life-long preparation for old age are not fully established in Korea, older persons tend to rely on their children and have a lower economic status compared to the total population. In 1998, 8.2 percent of older persons were Livelihood Protection recipients. This rate is more than 3 times the total population( 2.6 percent). It is urgent therefore that the income security of older persons be guaranteed.

The social security system, however, is not yet fully established because of the short history of the social pension system. Due to the introduction of Old Age Pension, the foundation to secure minimum income for older persons has been established. However, the limited coverage of the current Old Age Pension, $15 \sim 50$ thousand Won, is not even sufficient for pocket money, let alone for livelihood expenses. It is doubtful whether this will actually affect the prevention of poverty.

In addition to the above, because the average age of retirement is lower than that of OECD countries, the opportunities for social participation are limited and the self-reliance of older
persons is low. Therefore, it is an important policy issue to provide employment opportunities for older persons. In reality, due to the economic crisis, the circumstances for the employment of older persons are getting worse.

Second, the health and medical needs of older persons are increasing and becoming more diverse. 86.7 percent of older persons have at least one chronic disease. 31.9 percent have difficulties in at least one of the items in Activities of Daily Living and 3.5 percent have difficulties in every item in Activities of Daily Living. A health and medical system for chronic cases, however, is not established yet. In particular, the social care services for older persons with dementia and bed-ridden elderly is not adequate. The hardship on family members is very severe.

On the other hand, due to nuclearization and the small family norm, elderly only households are increasing. In 1998, 45.9 percent of older persons were not living with their children. The female labor force participation is also increasing. Therefore, family care, which was provided mainly by female family members, now cannot be taken for granted. Currently, social care services including home help services, short-term care centers, and day care centers for older persons are very limited.

Third, older persons' leisure activities are home-based and their social activities are limited. Older persons have spent most of their time working just to make ends meet and do not have enough money to enjoy leisure activities.

Fourth, only a small portion of older persons( 0.35 percent) are under institutional care. Considering that around 5 percent of older persons are under institutional care in OECD countries, the coverage of institutional care is very limited.

Finally, the budget for older persons is 0.24 percent of the national budget and too small to provide adequate services. Considering that the majority of welfare expenditures are for Old Age Pension, budget to welfare services for older persons has to be increased. Also, the current administrative organization is not sufficient to deal with the various issues of income security,
employment, health and medical services, housing problems, and leisure activities. Considering the above factors, it is urgent that Korea establish the social infrastructure necessary to keep prosperity in an aging society.

## B. Future Plan of the Korean Government

The Korean government formulated the ${ }^{『}$ Mid- to Long-Term Development Directions for Elderly Health and Welfare in Preparation of an Aging Society in the 21st Century』 in 1999. The formulation of the above plan can be contributed to the rapidly increasing aging population and the weakened function of the family in support for older persons. It is especially important that focus of the whole nation be put on this increase and on the preparation of appropriate countermeasures because the speed of aging in Korea is much faster than when compared to other countries.

## 1) Fundamental Directions of the Plan

Basic direction of the plan can be summarized into five principles. First, policies for elderly health and welfare must be considered in universal welfare services. Currently, services are focused only on the lower class elderly. However, in order to actively meet the various welfare demands of older persons, the government should establish a policy to develop not only selective welfare services focusing on the vulnerable elderly but also universal welfare services which target all older persons.

Second, policies should improve the quality of services and the efficiency of social welfare administration systems by integrating independently operating programmes. It is necessary therefore, to create close linkages between the health and social welfare sectors. The public welfare delivery system must also be modified to be customer-oriented.

Third, the welfare system must be made productive. Focus must be put on harmonizing market principles emphasizing
efficiency and self-reliance with non-market ideals stressing equality and community. For example, the government should provide not only direct income benefits but also promote employment opportunities and volunteer activities.

Fourth, balance between social care and institutional care should be achieved. Availability of social care allows older persons to reside in the community as long as possible. Therefore, social care should be expanded. On the other hand, there are not enough institutions for older persons who cannot live independently and have no one to depend on. Therefore, the construction of institutions for older persons should not be overlooked.

Finally, the government and private sectors should share their roles and cooperate with each other. The public sector should secure a national minimum standard of living including basic living needs, medical treatment, education, and housing for Livelihood Protection recipients and the lower class elderly. Private for-profit companies should be involved actively in the provision of care services and institutional care.

## 2) Goals and Strategies

Goals and strategies of the plan can be summarized as in Figure 5-1. The first goal is to secure a national minimum standard of living for older persons. Both construction of an income maintenance system and promotion of employment are required. A nationwide social pension system should be the backbone of income maintenance for older persons. Also, income security of older persons should be strengthened by improving Old Age Pension. The government will expand coverage from 658 thousand persons in 1998 to 924 thousand in 2001. All recipients will receive benefits of 50 thousand Won. There will be expansion of Elderly job placement centers(from 70 centers in 1998 to 90 centers by 2000) and Elderly workplaces(from 511 workplaces in 1998 to 631 in 2003) to promote job opportunities. Vocational training will be provided through Elderly schools(453
schools in 1997), and Multi-purpose senior centers(97 centers in 1997). In addition, the government will focus on creating part-time jobs and increasing designated jobs appropriate for older persons from ages 60 to 80 by the year 2000 .

Figure 5-1. Summary of Goals and Strategies

Second, to ensure the healthy lives of older persons, the regional service delivery system has to be modified to adequately respond to the demands of customers. In order to expand public health and medical services, the budget for free health examination programmes will be increased from 252 million Won in 1999 to 718 million Won by 2003. Protection measures for the local elderly will be strengthened, including dispatching of in-home volunteers and management of day and short-term protection facilities. Also, there will be expansion of hospitals that specialize in dementia( 12 hospitals in 1998 to 16 hospitals by 2003) and of nursing homes for the protection of those elderly with dementia who are difficult to care for in the home(24 nursing homes in 1998 to 50 nursing homes by 2003).

Medical fees and the burden of care, by families who have difficulty in caring for older persons with chronic diseases, will be lessened through such countermeasures as expansion of the present scope of benefits in health insurance and introducing a separate system for care allowance.

Third, the government will establish the infrastructure for welfare services. social care services will be expanded by establishing service centers(130 home care service centers in 1998 to 250 centers by 2003). Coverage will also be increased by constructing additional free or low-cost nursing homes(66 institutions in 1998 to 100 institutions by 2003). As a result of the demand for long-term care services, there are plans to systematically make a transition from elderly homes to nursing homes to expand the supply infrastructure for welfare services. Also, construction of charged nursing homes and retirement communities for the elderly by private companies will be encouraged.

Finally, financial support to elderly activity centers will be expanded(from 28,850 centers in 1998 to 33,000 centers by 2003) and additional multi-purpose senior centers will be established(80 centers in 1998 to 150 centers by 2003) in order to allow older persons to continue their social activities and lead a fulfilling life
after retirement. Also, the regional volunteer activity association and social volunteering of older persons will be promoted to maintain the respect for elders in their community. Active social participation of older persons can be encouraged by developing lifelong education programmes.

[^0]:    1) This is due mainly to the large gender gap in the probability of dying in age groups between 40 to 45 and 45 to 50 years of age. The indication is that the shorter life span of men in Korea is a result of men's economic participation and their associated health practices. Insecure and stressful work environments and poor health habits are responsible for the high risk of death among economically active men.
[^1]:    2) This is based on the National Fertility and Family Health Survey(Youngchan Byun, et al., Study on Dementia Mapping, KIHASA, 1997).
[^2]:    3) Regarding each welfare policies for older persons, see Chapter 4.
[^3]:    4) These policies are planned and implemented by the Division of Elderly Welfare.
[^4]:    5) Under the Elderly Welfare Law, the government pays 70/100 of Social Pension expenditures and regional self-governing groups pay 30/100. In Seoul though, the government and city each pay half.
